Getting HW5

1. Clone the repository
   In GitHub Desktop, Clone the repository
   https://github.uiowa.edu/cs2230-assignments/query-processor-sp19.git

2. Create the project
   In IntelliJ, create a new project from existing sources. The folder you choose should be the "query-processor-sp19" folder (the folder that step 1 created on your computer). GitHub Desktop will help you find the location.

3. Setup to push to your own private remote repository

   a. In GitHub Desktop, make sure Current Repository says query-processor.
   b. Now go to Repository > Repository Settings
   c. Change the URL in Primary Remote Repository (origin) to
      https://github.uiowa.edu/cs2230-sp19/hw5-hawkid
with hawkid replaced by your own.

   d. Do a Push.
      a. If you get the error "The repository does not seem to exist anymore. You may not have access, or it may have been deleted or renamed," first check https://github.uiowa.edu/cs2230-sp19/hw5-hawkid in your web browser. If the URL does not exist then, email the course staff with the Subject: "missing HW5 repo" and the Body: your hawkid.

DO NOT simply push to a different URL if the above does not work. We will not see it and will not count the homework as submitted. Get help well before the deadline.

When finished, you can verify that your private repository is on github.uiowa.edu by going to https://github.uiowa.edu/cs2230-sp19/hw5-hawkid in your web browser. You should see the starter code for HW5.
